NIR laser induced ablation of rutile titania under ultrasound irradiation in water. To study the ablation of rutile titanium dioxide (TiO₂) powder under different conditions. TiO₂ powder was laser excited under Nd:YAG (1064 nm) irradiation in the presence of ultrasound (US). The laser fluence was 5 J/cm². The irradiation time was varied from 10 to 20 min. The crater area was estimated by a laser scanner. We measured the optical absorption spectra by a Fourier transform infrared spectrometer. When US was added, the optical absorption decreased with an increase in the irradiation time. In the case of only laser irradiation, the optical absorption was enhanced with an increase in the laser fluence. The ablation rate was estimated from the change in optical absorption of TiO₂ powder and the laser fluence. In the presence of US, the ablation rate increased with an increase in the laser fluence and reached a maximum value at a laser fluence of 1.2 J/cm² with an average ablation rate of about 2.5×10^{-4} cm²/J. No significant difference was observed in the ablation rate of TiO₂ powder in water by addition of US.

Confocal laser endomicroscopy (CLE) is an emerging technique for evaluation of mucosal surface lesions. Its use may aid the assessment of malignant lesions and in the monitoring of inflammatory bowel disease. The technique is performed via a swallowed capillary endoscope with a diameter of only 5 mm. The smaller capillary endoscope (CLE) has the advantage of a much shorter examination time and potentially provides a real-

time biopsy of the mucosa. For this reason, CLE is increasingly used in clinical practice. In the current issue of Gastroenterology, Stjern et al. \[[@CR1]\] have reported on the diagnostic value of CLE in the evaluation of dysplasia and ulcers in the esophagus. One strength of this study is the large number of patients and the endoscopic assessment of dysplasia as a gold standard. Another is the excellent performance of CLE in visualizing dysplastic lesions. In addition, several important points are noteworthy: (1) in comparison to histology, the sensitivity of CLE was very 2d92ce491b
