Of 207 patients with cryptococcal meningitis evaluated for antifungal therapy response in a prospective study conducted in central China from 2002 to 2006, 94 (46%) showed apparent clinical response to the first therapy. Among them, 32 (34%) showed repeated response to fluconazole, whereas the others showed no response or relapse of meningeal symptoms. Two of the 32 patients experienced clinical relapse of meningitis after cessation of fluconazole treatment, and one of these patients was successfully retreated with another antifungal agent. In the 30 patients who did not respond to fluconazole, the most common antimycobacterial regimen was isoniazid/rifampin plus ethambutol followed by fluconazole, but treatment failed to produce apparent change in the cerebrospinal fluid (CSF) cell count, CSF glucose level, CSF protein, or CSF/blood glucose ratio for any of the patients. This study shows that fluconazole is an effective therapy for cryptococcal meningitis in this region of China and suggests the possible involvement of endogenous virulent microorganisms other than Cryptococcus neoformans or early and aggressive fungal invasion in the development of this infection.Multipath-Based Polarization and Location-Aware Mapping for Radio Detection Systems. The location awareness of a ground-based radio detection system (RDS) is an important issue to ensure it is sufficient for detecting a distant target. According to the polarity of the target radio, the mobility of the target determines the polarization of the target signal, and the position of the target is determined by the angle of arrival (AOA) of the received signal. In this work, a method is proposed to achieve the multilevel polarization and location-aware mapping for RDSs. In our approach, a 3D direction-polarization-angle (DPA) library is built through the coordinate transformation, and the mapping is achieved through the conversion between the polar coordinate and the DPA library
