Thin-film stress-induced crystallization of amorphous films of pentacene and an o-quinone compound. We have examined the effect of stress on the crystallization behavior of thin films of pentacene and o-quinone. The thin films were prepared by a vacuum deposition technique using dioctylphthalate (DOP) as a dispersing medium. The stress in the films was imposed by using the pressure-sensitive adhesive tape PS 610 as a release sheet. X-ray diffraction studies showed that the crystallization of pentacene is promoted by the tape stress. The volume fraction of the crystal increases with an increasing amount of PS 610 on the surface of the sample. The tape stress also facilitates the crystallization of o-quinone in the DOP-rich phase.
