The help on Adobe.com is absolutely wonderful. If you have a question about any aspect of Photoshop, you can search for the solution or consult a tutorial on Adobe.com. To access the tutorials, go to www.adobe.com/photoshop/tutorial.html and click on "Photoshop Quick Tips" for entry into the Photoshop Tutorials and Guides section. Although Photoshop is a big beast that has grown large over the years, it's still light enough to use proficiently. Even if you're not a digital artist, your knowledge of the tools that can help you create images can come in handy. So, check out these tips for getting the most out of Photoshop CS3. Tinkering with the workspace When you first open Photoshop CS3, you see a somewhat large workspace, as shown in Figure 16-1. This is where you get your most familiar environment, including the workspace window and the tools (including brushes, brushes, and filters) that live in the toolbox along the bottom. The workspace can hold up to four layers and support tabs and windows. You can move and resize tabs to make them as large as you want. **Figure 16-1:** The workspace is at the center of the editing screen. I show you how to work in the workspace and how to create your own layout that's a perfect fit for your eye and work habits. Editing with Layers As an editing program, Photoshop starts as a lot of images tacked onto a background and arranged on separate layers. That's the basis of the editing process: Beginning with layers, making changes to these layers, and then applying those layers to another image. Photoshop CS3 introduced the Layers panel (seen in Figure 16-2). The Layers panel is a main tool for making changes to images. You start with an image, make changes to that image, and apply those changes to a different area of that image. If you're happy with what you've achieved, you can save that image to output directly from Photoshop, save it to other file formats, or — if you're a real expert — discard the image and start again. The Layers panel is also the default way to organize images in Photoshop. If you create one picture, you don't have to create a new canvas for each part of that image. Just find the area that you want to make changes in, add that area to the Layers

Q: How do I recursively read text files in java? I am very confused. How do I read, say, 10 lines of text from a file in java? I have already tried this: public static void Main(String[] args) throws IOException { FileInputStream fis = new FileInputStream("home/test/input.txt"); BufferedInputStream bis = new BufferedInputStream(fis); BufferedReader br = new BufferedReader(new InputStreamReader(bis)); char[] buffer = new char[1024]; int count; String word; while((count = br.read(buffer)) > 0) { for(int i=0; i 0) ...but then says: while{

Also, you can connect to the BasicChatBox through the EQ API, pretty easy to use. You can find more info on that here: Adding a custom channel widget in the BasicChatBox can be done by extending the BasicChatBox object via WidgetBuilder. This way you can create your own listview or something else. You will need to implement a WidgetFactory, WidgetDelegate and an API getter. And here are the init parameters you need for the widget: | | widget: the widget | | style: a string with a style (optional) | | moreThanOneLine: if true, the widget will be more than one line (can't be combine with align) | | align: if a value is given, it will be applied to the widget's alignment | | width: the width You need to define all properties that are supported by the widget, if they are missing, the widget will simply render nothing (defaults here)Q: Prevent img/background-color-offset property from collapsing. The images in my HTML page are sized according to the actual content. For example, for a chart, the height of the chart would be 100% of the window's height. But the background color of the entire page is set to transparent using the CSS property img or background-color-offset. Because the image is not sized the same as the surrounding content, the background color shifts upwards due to the excess height (image below will use red for the background color instead of the #ccc color) Is there any way to prevent the background color shifting upwards, but keep the image sized according to the document's height (and therefore not having to set the height of the container to something like 100vh)? A: The issue is that the background image is treated like a "background-color". That is, the background-color property has no effect on the intrinsic width and height of an element's background image. The background-color property affects the background color of the element, but it still takes up space in the DOM. You'll have to either set the background-color on the element, remove the background image, or keep the image and apply the background color to the element. Q: Call the function inside
