
Data Factory

A sample file like the one below which can be obtained from the below link Data Factory Output: This is what the Data Factory generates. Cloud Shell Solution for Data Factory Create a Cloud Shell with latest Data Factory Login to your Cloud Shell with the Azure account az login Once logged in, create a new environment and name it Data Factory (Example: Data Factory) az accounts set-identity --subscription "SAZURE_SUBSCRIPTION" --resource-group "SAZURE_RESOURCE_GROUP" --name "Data Factory (Example)" Install latest version of Azure CLI tool that you will use for the rest of the steps [Optional] If you already have the Azure CLI tool installed, you can skip this step. az group create --name "Azure CLI" --location "East US" [Optional] If you already have the Azure CLI tool installed, you can skip this step. wget tar xvzf azure-cli-latest.tar.gz [Optional] If you already have the Azure CLI tool installed, you can skip this step. chmod +x azure-cli [Optional] If you already have the Azure CLI tool installed, you can skip this step. ls -la /root/azure/ Create the Azure Active Directory credential az ad credential create -n "SAZURE_CLIENT_ID" -c "SAZURE_CLIENT_ID" --password "SAZURE_PASSWORD" -d "SAZURE_RESOURCE_GROUP" -r "SAZURE_RESOURCE_

What's New In Data Factory?

Data Factory is now fully managed. Azure has taken care of provisioning, configuring, and updating Data Factory resources. Data Factory is now accessible from the Azure portal and is no longer available as part of the preview preview. You can create data factories with a specific runtime engine, or you can create a data factory using the default runtime engine and later change it if desired. You can automate the activation of the Data Factory in the portal to immediately create the data factory and deploy its components, including a subscription and a storage account that provides storage for the data created by the data factory. You can automate activation and deactivation of the data factory by using the Azure Automation service. Here is an example for STS : Resource Group already created with Azure Subscription. Azure Resource Name : is the name of the resource group. Data Factory Resource Name : is the name of the data factory that created your resource group. Output will be like this: This will let you know that this instance of the data factory is in your resource group. So basically for your use case: You have all your resource group's needed You specify the URI of the Azure Service to use from the CLI You are not specifying a subscription so that the Data Factory will use the subscription of the resource group you select A: You can use Azure CLI to run Azure Automation Runbook with any subscription directly. For how to run Azure Automation Runbook with some scripts, you can check You can also create the storage account manually, because you do not have Azure subscription, I think it is your requirement, please check the create storage account from CLI, you can find it in ADF documentation. Output will be like this:

System Requirements:

Operating System: Windows 10 (64-bit) Processor: 2.0 GHz processor RAM: 2 GB GPU: 32 MB Hard disk space: 5 GB System requirements are subject to change. If you have feedback on this, please e-mail us at . Supported Display Resolution and Refresh Rate: Supported Screen Mode: 640x480 (16:9), 720x480 (16:9), 800x600 (16:9), 1024
