SSH Command works by issuing multiple SSH commands (essentially the same as the shell command) to remote hosts. While the user may prefer to issue the same command multiple times, it is considered best practice to issue each command with a passphrase, as repeated SSH command may cause the server to assume an insecure connection. Because the programs uses SSH (Secure Shell) this should be safer than a text-mode password prompt and should keep the connection open. Host names, IP addresses and AES encrypted/Base64 encoded passwords come from a configuration file, dynamically creating GUI labels. The SSH Command can connect to multiple hosts at once, can be saved to disk for later execution, and may be monitored for updates. There are a number of options for the connection and the results can be saved to disk, as well as displayed as a CSV (Comma Separated Values) file. SSH Command supports multiple commands and can show the output of each in the same window. SSH Commander supports.NET Framework 2.0, 2.0 Compact Framework, 3.5, 3.5 Compact Framework and Silverlight.
