Connecting devices are devices or systems that are attached to the body of a user such as a person, patient, animal or the like for sensing and/or measuring the biological activity of the user or for delivering a therapy to the user. Such devices may be used to monitor a patient's health and/or provide therapy to a patient.

A patient may also be able to communicate through a connecting device. Connecting devices may also be attached to machines for sensing, monitoring, and/or delivering therapy to the machine. The connecting devices may sense or measure the biological activity of the machine for a variety of purposes. For example, the machine may be a rehabilitation machine or a life support machine. The connecting device may provide therapy to the user or machine by delivering a therapy.

Some examples include: monitoring infusion pumps in hospitals to ensure proper delivery of medications to a user; detecting motion/activity in a person's home to turn on or off lights, heating or air conditioning to that person; and detecting motion in a machine to turn on or off lights, heating or cooling to the machine. Theoretically, any machine that moves or acts in a way can be monitored by attaching a connecting device to the machine.

The werewolf becomes a major character in The Wardstone Experiment, and his portrayal has changed greatly. Peter was a well-written character, but was overwhelmed by the horror of the role in the first film, and he looked far more wooden than he did in the Richard Curtis original. In the second film, the actor has added the weight of the role to make up for this, and his portrayal is absolutely perfect. The movie is not just about the werewolf, though: the story and the acting
