Now, Shell has a different take on the shale gas era. In a presentation to investors in London earlier this month, Shell's executive vice president for external and regulatory affairs, Richard Rossiter, made a case for how natural gas should be both a bridge to clean energy and a breakthrough fuel. That presentation covers a shift in Shell's strategy that the company announced in November after announcing a \$50 billion investment fund to build more ethane extraction plants across the U.S. U.S. carbon intensity is falling, thanks in no small part to natural gas, and the trade has gone from a drain on the economy to a source of great economic promise. The next big step forward in natural gas, Rossiter argued, was to turn it into something that can be burned as a complete fuel. That wouldn't mean renewable energy necessarily, as the green energy industry is still trying to figure out how to utilize gas, but it would represent a significant change in thinking about the resource. At some point, Rossiter said, the industry should shift to using natural gas as a heat source rather than using it only for electricity, because burning a fuel the way its made isn't a good option for fossil fuels in general. "The fuel that we make out of natural gas is the same fuel that is burned for electricity, and burning it the way it is made is not actually the most efficient way to use it," he said in an interview with Yale Environment 360. "It's the best one for exporting jobs overseas, for pumping up domestic prices, and that's not what we want to do with natural gas." In his speech, Rossiter suggested that when it comes to greenhouse gas emissions, natural gas is the most emissions-efficient way to use a fuel. While coal creates a ton of emissions for every unit of energy produced, natural gas produces about half that amount. For that reason, he pointed out, the United States needs to expand its natural gas infrastructure, including pipelines, to get more of the resource to
