Volume: The Volume parameter is used to change the pitch, intensity, loudness, and reverberation of the generated music. You can also add reverb effects to create a more sophisticated composition. Microphone: The Microphone parameter allows you to change the sound of the generated music to fit your needs. You can play, select, and record the samples. Furthermore, you can use the sample voice to make your composition sound interesting. Mixer: You can adjust the level of each instrument, effect, and so on. You can also mix different sets of instruments, effects, and sounds in order to get the best results. The Mixer mode allows you to understand and discover the role each individual component plays in the creation of a given sound. Step-sequencer: You can start your song with the Step-sequencer. When you open the editor for the first time, you get access to the Step-sequencer, which allows you to choose different ways to mix and sequence tracks. Oscillators: The Oscillators parameter is used to change the pitch and rhythm of the generated music. You can set the oscillator type (a macro oscillator, a sub-oscillator, or a sub-sub oscillator), the period, and the amount of oscillations of the created music. Modulators: The Modulators parameter works like a scale. You can play and record a sound and modulate it with the Oscillators parameter to get a new and interesting sound. This feature is particularly useful if you need a scale in your composition. Bitcrusher: By using the Bitcrusher parameter, you can change the sound of your composition by changing the amount of bits per sample. EQ: The EQ parameter is an eight-band equalizer, which allows you to change the individual frequencies of the generated music. You can adjust the loudness and reverbs of each band. Step-sequencer: The Step-sequencer parameter is used to change the order of the individual tracks in your composition. You can also set the tempo for each track. Master Volume: The Master Volume parameter is used to increase the volume of the individual sounds in your composition. Effects: The Effects parameter works like a chain of effects. You can change the effect type and depth. Breakpoints: Breakpoints parameter are used to change the structure of the generated music and adjust the song duration. Beatmeter: In b7e8fd5c8
