*** **Creative Suite:**** This is a combination of three different programs that include the Photoshop program itself: * Adobe Photoshop Elements * Adobe Photoshop Lightroom * Adobe InDesign Adobe Photoshop The primary program in the suite, Adobe Photoshop has been the industry standard for image manipulation since the program was released. This is still true today. It can be expensive and confusing to learn. But if you have Photoshop, then you have the ability to make almost any digital image correction or alteration that you need. Photoshop is the tool of choice for those who manipulate photos. Photoshop Elements For those who like the convenience of the compact version of Photoshop, Adobe Photoshop Elements is useful. This software is less expensive and includes a photo library manager and an image editor that enables you to easily correct common photo problems and apply basic effects. Elements is designed to make it easier for users to get started in image editing. Adobe Lightroom Adobe Photoshop Lightroom is a program that works like a digital darkroom. It allows you to control settings in the program and organize photos. These settings include adjustable exposure, white balance, contrast, brightness, and color. You can also share photos on a simple, intuitive interface. Adobe InDesign Adobe InDesign was designed to create layouts for the web and other print environments. If you're working with graphic design, you might find this program useful, but just as many professional photographers use Photoshop Elements or Lightroom to do the edits that need to be done before moving the file into Photoshop. Adobe Photoshop has a large selection of additional plug-ins that offer special effects and advanced editing. The community has created dozens of plug-ins to enhance the main editing program. Most of these can be installed on your computer at no charge. Chapter shows you how to search for web templates and other tools that you can use to enhance your photos on your computer. Photoshop is a large program with many features, so knowing when to use which features can be confusing. However, with some practice, you'll get good at the many commands and functions. Just remember that the program doesn't know your name, so if it's not working for you, don't force it to do something it doesn't do. TIP It's possible to use Photoshop to modify images on the web. You can do this by using the Adobe Photoshop Web Application (see the "Phot

Caleb Baldwin's Twitter profile: "First off, #hotgirl rules (kind of)" Caleb Baldwin's Twitter bio: "I don't know what this is but, Jhugnup I guess?" What I know about him: Baldwin says he is currently a freshman at North Carolina State, trying to graduate this spring. He grew up in the in the Harlem section of Manhattan and played for a year at Trinity School. What we think of him: A decent player, who is obviously very tall but has a thin frame, Baldwin has good touch. He doesn't do anything spectacular, but I think he is a solid basketball player who will be successful.

Q: What is the best approach for raising the pitch of a soundcard input to match that of an external microphone? I have an older laptop running Windows XP with an onboard soundcard but also have an external USB mic. When the laptop sounds play through the internal soundcard and then go to the external mic (plugged into the soundcard's output jack), the sound quality is very poor due to the speaker and mic being at different pitches. How do I raise the pitch of the soundcard's input to match that of the external mic in order to get a better sound quality? The sound quality in the soundsettings dialog is "max" (as it should be I suppose) but when the laptop plays through the soundcard and then goes to the external mic, the sound quality is very poor. Thanks

A: If you have an external mic plugged directly into your soundcard, then you won't have any facility for automating this. However, you can use some software like Audacity which will make it very easy to set up effects in order to create an automatic system that does what you want. You'll want to have the external mic on it's own track. Say the name for the input track is MyExternalMic, then turn on the track volume so that it's just as loud as the other tracks. Turn on your mic on one of its tracks and use the input settings to set a gain of around +10dB and a highpass filter of 500Hz. You can then drag a copy of this track to the mix. In the effects tab of the main window, you can turn on the copy effect. If you drag the 'drag signal from' from your track and set the destination to your mix, it will give you a

Q: Initializing a struct within a struct This issue has been driving me nuts and as always, I'm looking for a better way. What is the best way to initialise a struct value within a struct? Let's say we have a three class hierarchy. User id Name Address Room id Name UserID User has a list of Rooms. I want to be able to pass a room to User, then check that room's id and apply any custom settings to the room. I can't change the way rooms are stored in my database. I could pass the User and room id into a constructor for User and instantiate the User with the room id. Or I could instantiate User with the Room and pass that into User. However, I'm not sure how I would create the instance of User within User. I could also store User and Room in the same struct, but then I would have to do some intricate struct property setting, and be very careful that the Room doesn't get set to null. I could also pass the Room into the constructor for User, but then my users will often pass the Room into the constructors of other objects for free - which would mean a lot of 'setRoom' calls on every property. What is the best way to initilise this type of scenario? Thanks :)

A: What is the best way to initialise this type of scenario? Make User and Room their own classes and have properties inside of the classes to reference each other. User has a list of Rooms. I want to be able to pass a room to User, then check that room's id and apply any custom settings to the room. If User has a list of Rooms, you should put the rooms in the list and not create an instance of Room within a User. What if you wanted to get the room based on the id? Or create the object later? Would you have to go through all the rooms in the user and replace the id in every instance? A: The best way to initialize a struct within a struct, is to use a constructor that takes a reference to a struct. This way you do not have to do anything special. E.g. struct Room { Room(User & user) : user_(user) {};
