Although Photoshop is free and the world's most popular software, it's not always an affordable or easy-to-use tool for beginners. Thankfully, Photoshop is an incredibly powerful and versatile program. Whether you're a beginner looking for a basic image editor to transform your photos into world-class masterpieces or an experienced user looking for more ways to edit your images, Photoshop will keep you motivated throughout your creative process. The most important thing to remember when using Photoshop is to adjust your settings first. Then, once you've figured out how to use the software, you can experiment with all the different settings to get a feel for your images before you start editing them. You don't want to spend a lot of time re-doing work if you aren't sure how to improve your edits. I have been doing this now for 10 years and had my first child in 2008.I am taking time off after the baby is born to plan the next chapter of my life. Trying to schedule a massage for the second Saturday in March. I had IBS for many years and finally got a colonoscopy to get a DR who advised me to go on with the new colon. My doctor is no longer on the GI/Endo block and I no longer go to her. I just assumed my colon was "fixed" and have not been getting the regular "guess-of-the-week". I go to an ER if needed. It seems if I go to a regular or GI clinic, they do not "want" to see me or me going to the ER.Electrocardiographic features of supraventricular tachycardia in children with Wolff-Parkinson-White syndrome. Supraventricular tachycardia (SVT) is frequently observed in children with Wolff-Parkinson-White syndrome (WPW). The mode of a tachycardia is atrial fibrillation (AF) in the majority of patients. The electrocardiographic features of AF in patients with WPW have been reported sporadically, but these findings have not been compared to those in children without WPW. We evaluated the electrocardiographic features of a child with WPW who developed AF to compare these findings with those in children without WPW. We retrospectively reviewed the electrocardiograms of 40 children with WPW and 40 age- and sex-matched children without WPW, and compared the electrocardiograms of a child with WPW who developed AF (Group 1) to those with asymptomatic WPW (Group 2), both of whom underwent electrophysiologic study and radiofrequency ablation (RFA) with an accessory pathway (AP). The mean age of Group 1 was 9.4 years (range: 3-16), and that of Group 2 was 8.5 years (range: 3-16). Groups 1 and 2 were comprised of 32 males and 8 females. The four-chamber lead (V4) and His potential could not be detected in Group 1. The maximum HV interval was significantly shorter in Group 1 than in Group 2 (70 +/- 11 ms vs. 86 +/- 22 ms; p
