CodeFort Free Edition  
Serial Key Features: ·  
Code analysis and  
code protection.  
Disassembles, scans,  
detects, and reports  
potential problems in  
the source code of  
your project, without

---

affecting the quality and functionality of the output. • The ability to protect against two common methods of bypassing .NET security: managed redirection and reflection. A built-in

---

Redirection class helps you to achieve a safe security level for your application and avoid the need for a full-fledged redirector. · Flexibility to use any signature and product template, including All-In-One file or All-In-

---

One folder. Different combinations of signatures and product templates allow for a complete protection of your.NET or Silverlight application. · Advanced XML and BAML obfuscation.

---

When obfuscating the source code of a .NET or Silverlight application, you need to manually specify the classes that will be obfuscated. By using advanced XML and BAML obfuscation, Codefort is able to

---

rename references  
directly in the .NET and  
Silverlight code. This  
can increase the  
percentage of  
members

Codefort Professional  
Edition Specifications

So what can codefort

do for you? A. Code

Optimization Some

assemblies can not be

---

optimized without crashing and are a major cause of application crashes. Codefort can optimize your assemblies for you, thus it eliminates all sources of performance issues. If your assemblies are

---

optimized, the percentage of obfuscated methods and types in your assemblies will be increased. B. Types, Methods and Class Renaming codefort enables you to easily protect strings, ints,

---

doubles, chars,  
enums, interfaces and  
many more types and  
methods. By renaming  
the members, you are  
changing the type of  
the member, allowing  
you to protect types  
and members that  
your protection tool

---

can not protect by  
itself. C. XAML/BAML  
Protection and  
Obfuscation codefort  
enables you to protect  
your XAML and BAML  
code by renaming the  
references to classes,  
interfaces and  
methods within the

---

code. D. Auto Rename Definitions codefort enables you to protect your XAML and BAML code by renaming the references directly in the XAML or BAML code. This is a unique feature of codefort, as all other protection

---

# products

## **What's New In?**

Codefort Free Edition is a tool that works in "one click". It can perform the most common security and performance

---

optimization tasks, helping you deliver and protect your application without risking exposure of your intellectual property. The tool supports .NET and Silverlight 4 applications, but is

---

also able to optimize assemblies for C++ and ASP.NET/ASP.NET MVC applications.

Features: Conceal your assembly's content in many different ways.

Codefort can encrypt the names, types and

---

members of your class library, as well as the external assemblies referenced by your application (except for the JAR files). The coverage of the code can be configured and is heavily customizable.

---

Codefort's obfuscation only takes place on the assembly code, and does not touch the XAML code or the BAML code. Codefort can rename and reorder the input to obtain the desired output. You can use

---

Codefort in "one-click" mode to automatically perform obfuscation, deobfuscation and code migration. This feature will make sure that you can customize the obfuscation process to exactly meet your

---

project's needs.  
Codefort is able to use either your assembly library or any other assembly library as the "source" for your project's obfuscation. In other words, Codefort will take the assembly library

---

provided by your development environment and apply obfuscation, deobfuscation and optimization to it in order to deliver the final product. This eliminates any difficulties caused by

---

coding for a specific target assembly. With the right SDK options, Codefort can transform XAML to BAML. This is a special version of BAML obfuscation; while XAML obfuscation retains the names and

---

types of class  
members found in the  
XAML code, BAML  
obfuscation ensures  
that the names and  
types are preserved,  
but they are renamed  
so that the original  
meanings of the  
names and types

---

remain hidden.  
Codefort is able to remove and replace unsafe code from your assembly. Codefort can transform your existing assemblies to deliver them in any required DLL file format, such as .NET

---

Framework DLL, COM  
DLL or standalone  
EXE. Codefort can  
rename and reorder  
the output assembly,  
to fulfill your needs to  
keep things safe and  
easy to understand.  
Codefort is able to  
compress and shrink

---

the size of the  
assembly's code or  
resources Codefort's  
library uses the  
assemblies' metadata  
to create

---
