Becoming familiar with Photoshop The first thing you need to do when using Photoshop is to understand how the program works. In this section, I present the general workflow for creating and manipulating images. The following sections provide in-depth explanations. The following steps guide you through the Photoshop workflow for creating and manipulating digital images: 1. **Set up Photoshop.** The first thing you do is set up Photoshop so that it's ready to use. 2. **Create a new document.** After you set up Photoshop, you must create a new Photoshop document, an interface where you can do your work. Your settings determine where your new document is created. To start a new document, choose File>New. The New Document dialog box appears, as shown in Figure 2-1. You can also use the keyboard shortcut Ctrl+N (Windows) or -N (Mac). 3. **Name your new document.** 4. **Set the resolution.** You can either set the resolution manually or use a slider to determine the value of your image's resolution (in pixels per inch, or ppi). You may choose the 72 ppi or the 300 ppi setting to create a standard-size image. Otherwise, you can use any setting that you desire. The screen resolution may be different from the printer resolution; when you save the file, you select the settings accordingly. **Figure 2-1:** To create a new Photoshop document, you must first choose a name, and then choose a location where your new document can be stored. 5.

Greece is seeking to recover \$32 million worth of state property it claims was stolen from the Thessaloniki Olympic Museum. Thrashing in the media spotlight, the claim was filed by Greece's Supreme Court on Monday against a private company called Strategic Management Consultants, which it claims won a competition to manage the museum in 2004, but has yet to release funds. The court is seeking to impose a 40 percent fine in the dispute, which was first raised in 2007. The Ministry of Education and Religious Affairs is also said to have filed a complaint accusing the company of embezzlement and fraud. The Public Guardian of Thessaloniki will now handle the issue, a ministry spokesman confirmed on Monday. Although our current model for developing the science of health disparities (DH) brings together a variety of disciplines, expertise within our current program includes a focus in social, demographic, environmental, and behavioral determinants of health disparities as they appear in the U.S. Native American population. Thus, it is our goal to continue to develop the science of health disparities that takes into account the social, cultural, and ecological context in which Indigenous people live. In addition, we wish to support the next generation of investigators in the field by supporting individual and mentored career development. The goals of the Center on the Health of Urban Indigenous People (CHUIP) are to build on the strengths of its current program areas and incorporate the latest advancements in the area of health disparities into health services research (HSR) and public health practice, contributing to the elimination of health disparities among Native Americans. The CHUIP has 4 research projects with 3 cores: Project 1, a longitudinal cohort study of Respiratory Health in Urban Indigenous People in Northwestern Montana (Dr. O'Connell); Project 2, a cross-sectional study of adoption, parenting, and intergenerational family functioning in urban Indigenous communities in Manitoba, Canada (Dr. Kraus); Project 3, a cross-sectional study of health services access among urban Indigenous people living in Winnipeg, Manitoba (Dr. Chrastil); Project 4, a prospective study of cardiometabolic risk in urban Indigenous youth (Dr. Eber, M.D.); Project 5, a prospective cohort study of the mental and physical health of urban Indian youth; and the Mentored Career Development Award. Q: How do I force a TypeScript module to be loaded via require.js? I'm attempting to create a TypeScript module with a JavaScript library called Knex, using the Parse-server. With TypeScript I can create a module in the module directory with a single file called knex.ts: `/// import * as knex from 'knex';` With that module I can require it in a plain JavaScript file I'm loading via RequireJS: `var knex = require('knex');` `var k = knex('test');` However, I can't figure out how to get RequireJS to use the TypeScript generated by the Knex package, if that's even possible. I've tried several permutations of typing "knex", "knex.constructor", and even "import knex". None of them work. A: Right now TypeScript only generates JS syntax for classes, which is the most basic kind of usage. It's on my short-list of things to try.
